Our Vision

Zenith has a vision to maximise shareholder value through superior project generation and exploration activities.

Focus is on 100% owned Zenith projects, whilst partners progress multiple additional opportunities.

LITHIUM AND GOLD DRILLING COMMENCED - SPLIT ROCKS PROJECT

A large-scale dual-purpose drill program has commenced, testing lithium and gold targets at the Split Rocks project, Western Australia.

LITHIUM

A lithium drill campaign at Split Rocks is part of a larger initiative under the Zenith Lithium Alliance, a joint venture with the EV Metals Group (EVM), to secure lithium spodumene feedstock for EVM (ASX Release 13-Jan-22).

- Large scale, lithium prospective landholdings.
- An initial program of 14 RC drill holes will test four large scale pegmatite targets, Rio, Dulcie West, Estrela and British Hills East. An expansion of this initial program is likely.
- Project-wide geochemical screening programs are also underway with 1 x auger and 2 x soil crews working towards systematically sampling all the prospective portions of the 660km² land package. Over 1500 new samples collected to date.

GOLD

In addition to the lithium evaluation program, Zenith is also assessing the gold potential of the Split Rocks project, with significant success to date.

- Final assay results from the 150-hole aircore/slimline RC drill program completed in late 2021 have now been received.
- New encouraging near surface gold mineralisation was intersected. Initial 4m composite assay results, including:
 - 4m @ 1.3 g/t Au (eoh)
 - 4m @ 1.2 g/t Au
 - 4m @ 1.0 g/t Au
 - In addition, drilling returned a further 17 shallow intersections of gold mineralisation grading >0.4 g/t Au.
- New results are in addition to those already reported for the 150-hole program (ASX Release 18-Jan-22), that included:
 - 12m @ 2.9 g/t Au
 - 8m @ 1.8 g/t Au, including 4m @ 3.1 g/t Au
 - 8m @ 1.7 g/t Au, including 4m @ 2.8 g/t Au, and

- RC drilling of the gold targets will follow the lithium focused program and is designed to better define and extend gold mineralisation in the bedrock at Dulcie Far North as well as at Dulcie Laterite Pit, Dulcie North, Estrela, Scott's Grey & Water Bore.
- A program of 45 RC holes to test gold targets is planned
- Diamond drilling will provide material for further gold - leach testwork.

Commenting on the Split Rocks drilling programs, CEO Mick Clifford said: “We are very excited to get the drill rigs back to Split Rocks and kick off the start of our 2022 exploration campaigns. The initial program of lithium pegmatite drilling will allow us to get a decent picture of the thickness and mineralogy of four very large pegmatite bodies that we know little about. These pegmatite bodies, particularly those at Estrela and British Hills East, have only been identified by shallow RAB or aircore drilling that has not been an effective test.

The gold drilling is designed to assess the grade and continuity of gold mineralisation particularly in the fresh rock, across multiple targets where we have had significant success over the past 12 months in our aircore drilling programs.”

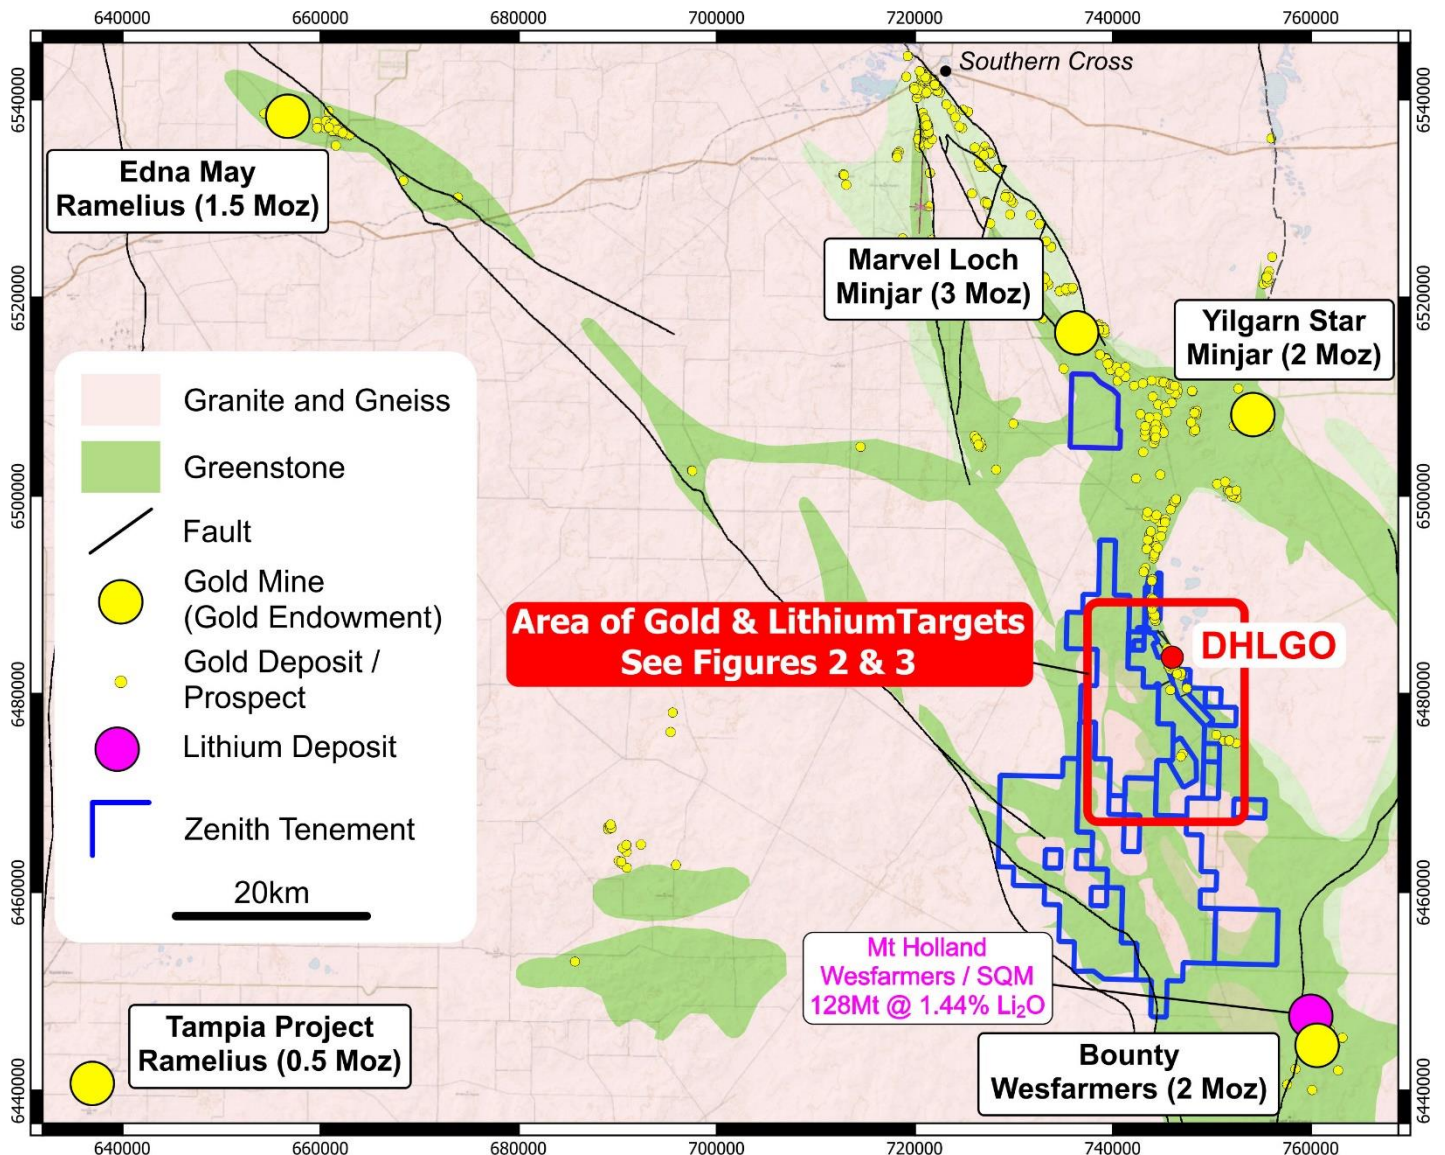

Figure 1: Figure 1- Split Rocks Project Location Map Showing Zenith tenements, Dulcie Heap Leach Gold Operation (DHLGO*) Prospect and Regional Lithium & Gold Endowment. (*Gold rights below 6m subject to option agreement).

Split Rocks Project - Background on Lithium Potential

Zenith has been systematically exploring the Split Rocks project, with landholdings of approximately 660 sqkm in the Forresteria greenstone belt, for lithium (Figures 1 - 2). This emerging lithium district is host to SQM-Wesfarmers Mt Holland/Earl Grey lithium deposit containing a Measured, Indicated & Inferred Mineral Resource of 189Mt @ 1.5% Li₂O (66Mt @ 1.58 %Li₂O Measured, 106Mt @ 1.52% Li₂O Indicated and 17Mt @ 1.11% Li₂O Inferred) (reported in KDR:ASX Release 19-Mar-2018).

Drill testing of four large, lithium pegmatite targets on the Split Rocks joint venture ground is underway: Dulcie West, Rio, Estrela and British Hills East.

The Dulcie West pegmatite (located within E77/2388) has been the subject of previous Zenith drilling, intersecting a flat lying pegmatite up to 77m thick that remains open ended to the north where the pegmatite rock chemistry shows higher levels of fractionation, a positive indicator for lithium fertility.

The Rio pegmatite is also a flat lying pegmatite, up to 65m thick, that has been intersected in 3 historic diamond drill holes. Drilling is planned to assess this pegmatite target that remains open in all directions.

Pegmatites up to 35m thick at Estrela have been intersected near surface in gold focused drilling over a strike length of 1.2km.

At British Hills East, historic shallow, RAB and AC drilling intersected pegmatites over 2.7km of strike, with one hole intersecting 53m of pegmatite to end of hole.

In addition, several lithium surface anomalies generated by Zenith through limited soil and auger sampling in the central west and northern portions of the project area require drill testing. Large areas considered prospective around granite margins in the centre of the project area are yet to be screened by surface sampling. Surface geochemical sampling programs to assess these zones have now commenced with both auger and soil sampling crews active on site.

Zenith Lithium Alliance

Zenith to refocus on lithium, and related EV-metals, backed by a new alliance with the EV Metals Group (EVM), as detailed in ASX Release 14-Jan-22.

- Key commercial terms of the Zenith Lithium Alliance with EVM includes:
 - EVM may earn a 60% interest in the lithium rights in two initial 100% owned Zenith projects Waratah Well and Split Rocks by sole funding the completion of a feasibility study within 24 months, with Zenith retaining a 40% project share.
 - On and from completion of a feasibility study, Zenith and EVM will form a joint venture in respect of the project lithium rights. EVM will sole fund expenditure to a decision to mine, following which the parties will be required to fund future joint venture expenditure in accordance with their respective percentage shares.
 - EVM must arrange all financing for the development, construction and commissioning of any future mine including Zenith's share. Zenith must repay its proportionate share of the project finance including interest from the sale of its proportionate share of minerals produced.
 - EVM to spend a minimum of A\$7M on exploration on the projects, in 24 months, before being able to voluntarily withdraw provided that if EVM does not complete a feasibility study within 24 months it will be deemed to have withdrawn and will not earn an interest in the project lithium rights.
- The agreement includes a joint venture over Zenith's Split Rocks and Waratah Well projects in Western Australia, as well as a non-exclusive right to bring additional projects to the joint venture by either party, to explore for lithium/EV metals.
- To allow the Zenith team to focus on EV-metal project generative activities, it is planned that the non-EV-metal projects, including base metals and gold assets will be demerged into one or more new companies to be listed on ASX. Any such demerger will be subject to ZNC Board approval, tax advice favourable to the Company, shareholder, ASX, ASIC and other regulatory approvals. ZNC shareholders to benefit by way of an in-specie distribution of the shares in the new listed vehicle/s. Further updates and information on the Demerger will be provided by Zenith in due course.

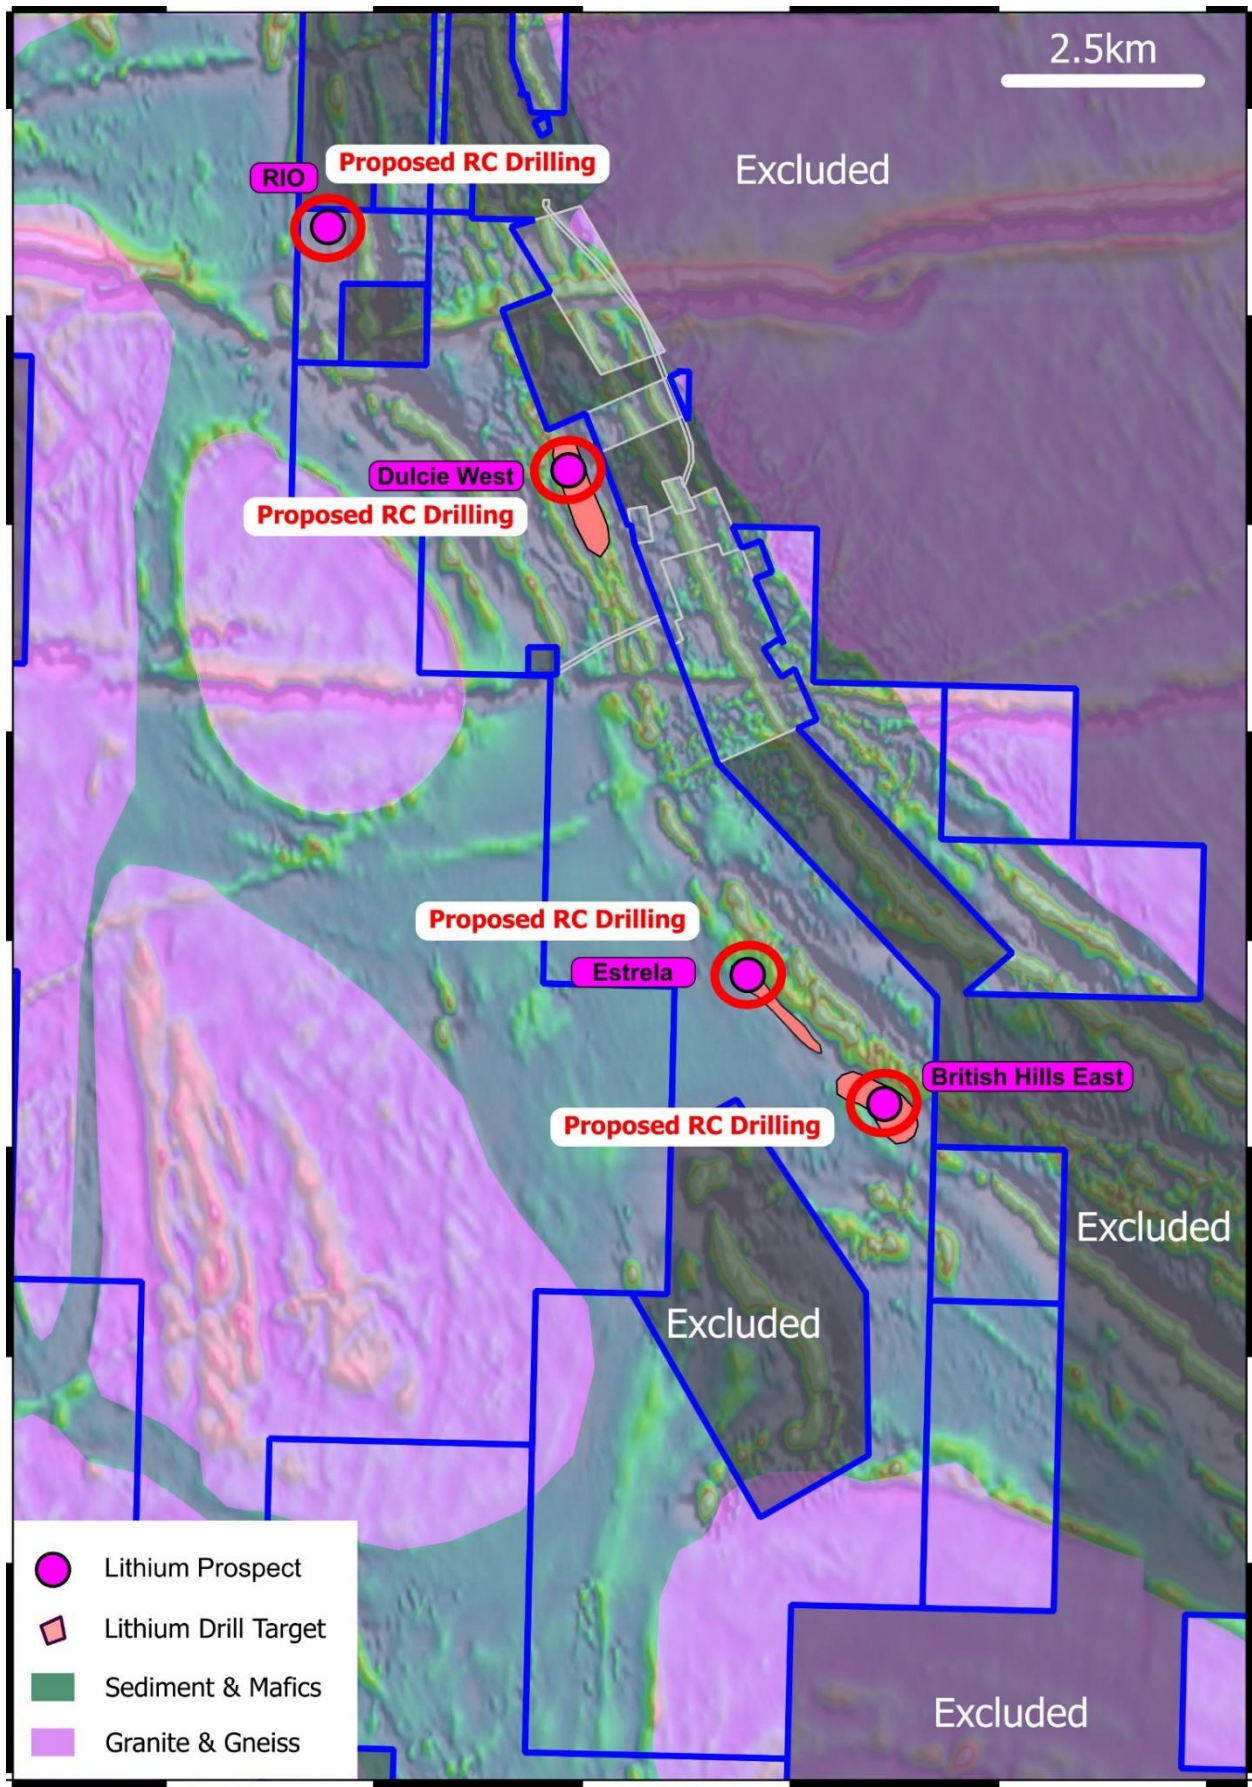

Figure 2: Split Rocks Project Lithium Targets showing Lithium Drill Targets.

Split Rocks Project - Background on Gold Potential

A major targeting exercise by the Company's geological team initially identified 12 high-quality gold drill targets at Split Rocks, subsequently expanded to 18 targets in the north-eastern sector of the Company's project area (refer to ZNC ASX Release 2-Sept-20).

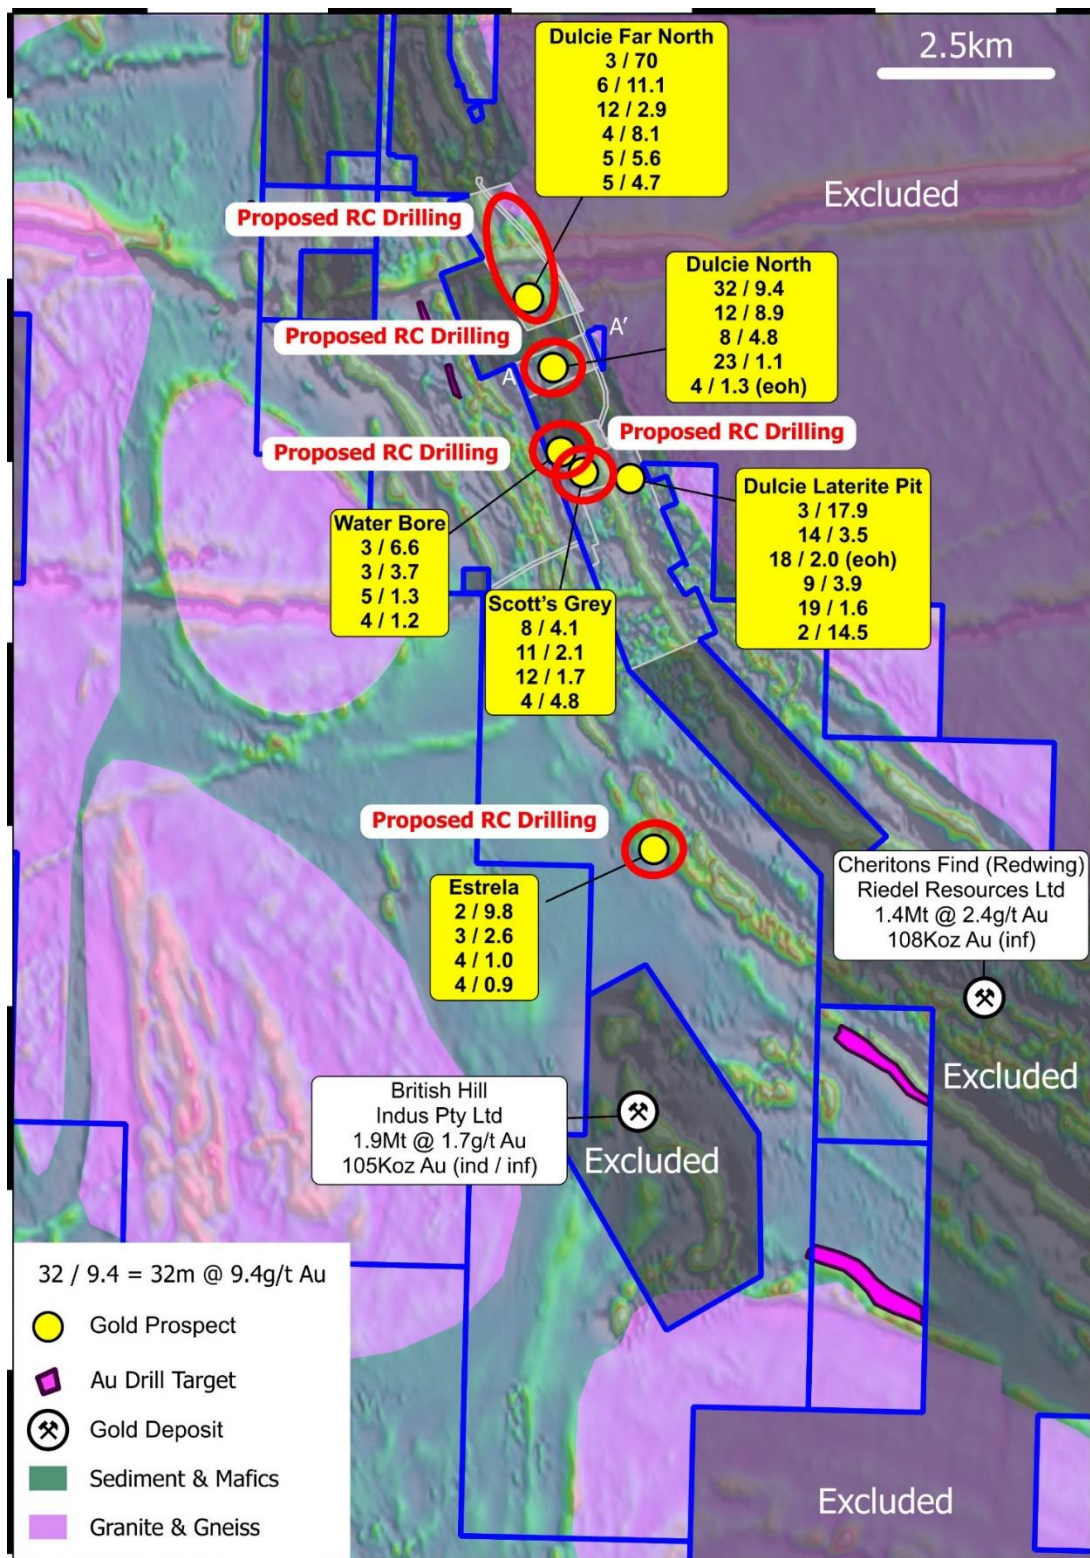

Figure 3: Split Rocks Project Gold Targets and Significant RC - Aircore Drill Results (yellow captions) showing gold drill targets, and areas of Recent Drilling

Drilling to date has tested 14 targets with outstanding first pass results returned to date at 6 prospects (ASX Releases 5-Aug-20, 2-Sep-20, 19-Oct-20, 28-Oct-20, 15-Jan-21, 11-Mar-21, 21-Apr-21, 24-Jun-21, 13-Jul-21, 30-Sep-21):

- Dulcie North: 32m @ 9.4 g/t Au, incl 9m @ 31.4 g/t Au
- Dulcie Laterite Pit:
 - 2m @ 14.5 g/t Au, incl. 1m @ 20.8 g/t Au,
 - 18m @ 2.0 g/t Au (EOH) incl. 1m @ 23.7 g/t Au
 - 14m @ 3.5 g/t Au
 - 3m @ 17.9 g/t Au
- Estrela Prospect: 2m @ 9.8 g/t Au
- Dulcie Far North: 5m @ 5.6 g/t Au incl. 4m @ 6.8 g/t Au, 4m @ 10.2 g/t Au
- Water Bore: 3m @ 6.6 g/t Au
- Scott's Grey: 8m @ 4.1 g/t Au, 12m @ 1.7 g/t Au

Infill and extensional slimline RC/aircore drilling (150 holes) has recently been completed at Dulcie Far North, Dulcie North, Scott's Grey, British Hills East and Water Bore with assay results awaited for the latter 5 prospects. New results from Dulcie Far North, one of 6 prospects drill tested in the program, show continuity of gold mineralised trends in the near surface, over a strike of approximately 1km north-south (refer to Figures 2 – 4 and Tables 1 & 2).

RC drilling on the significant near surface gold results at the 4 Dulcie targets, Dulcie Laterite Pit, Dulcie North, Dulcie Far North & Water Bore are planned with a rig booked to commence drilling in late January 2022.

Note Zenith retains gold rights at Dulcie Far North, Dulcie North, Dulcie Laterite Pit Zone and Scott's Grey below 6m, subject to the Dulcie option agreement (refer to ASX Release 21-Mar-19).

Competent Persons Statement

The information in this report that relates to Exploration Results and Mineral Resources is based on information compiled by Mr Michael Clifford, who is a Member of the Australian Institute of Geoscientists and an employee of Zenith Minerals Limited. Mr Clifford has sufficient experience which is relevant to the style of mineralisation and type of deposit under consideration and to the activity which he is undertaking to qualify as a Competent Person as defined in the 2012 Edition of the 'Australasian Code for Reporting of Exploration Results, Mineral Resources and Ore Reserves'. Mr Clifford consents to the inclusion in the report of the matters based on his information in the form and context in which it appears.

Material ASX Releases Previously Released

The Company has released all material information that relates to Exploration Results, Mineral Resources and Reserves, Economic Studies and Production for the Company's Projects on a continuous basis to the ASX and in compliance with JORC 2012. The Company confirms that it is not aware of any new information that materially affects the content of this ASX release and that the material assumptions and technical parameters remain unchanged.

Authorised for release by the Zenith Minerals Limited Board of Directors – 1st March 2022

For further information contact Zenith Minerals Limited:

Director: Michael Clifford E: mick@zenithminerals.com.au Phone +61 8 9226 1110

ABOUT ZENITH

In addition to its lithium assets at Split Rocks and Waratah Well, part of the Zenith Lithium Joint Venture with EV Metals Group, Zenith Minerals Limited has a portfolio of gold and base metal assets in Western Australia and Queensland.

A new major zinc discovery at Earahedy in Western Australia is to be fast tracked with extensive accelerated exploration programs underpinned by a recent \$40M capital raising by partner Rumble Resources Limited (ASX:RTR) (ASX Releases 28-Apr-21, 2-Jun-21, 8-Jun-21, 18-Oct-21, 13-Dec-21, 21-Dec-21, 31-Jan-22 and 21-Feb-22).

In Queensland an Inferred Mineral Resource 2.57Mt @ 1.76% Cu, 2.01% Zn, 0.24g/t Au & 9.6g/t Ag (ASX Release 15-Feb-15) underpins the Company's Develin Creek massive copper-zinc sulphide project. Recent 2021 drilling intersected massive copper-zinc sulphides at 2 new prospects, Wilsons North & Snook, a testament to the prospective nature of the extensive landholdings.

At Red Mountain in Queensland, drilling programs are planned to follow-up the high-grade near surface gold and silver intersected in Zenith's maiden & subsequent drill programs (ASX Releases 3-Aug-20 & 13-Oct-20, 9-Nov-20, 21-Jan-21 and 19-May-21).

Drilling returned high-grade near surface gold mineralisation at multiple targets in the Split Rocks gold project in the Western Australian goldfields (ASX Release 5-Aug-20, 2-Sep-20, 19-Oct-20, 28-Oct-20, 15-Jan-21, 11-Mar-21, 21-Apr-21, 24-Jun-21, 30-Sep-21 and 18-Jan-22).

To allow the Zenith team to focus on EV-metal project generative activities, it is planned that the non-EV-metal projects, including base metals and gold assets will be demerged into one or more new companies to be listed on ASX. Any such demerger will be subject to ZNC Board approval, tax advice favourable to the Company, shareholder, ASX, ASIC and other regulatory approvals. ZNC shareholders to benefit by way of an in-specie distribution of the shares in the new listed vehicle/s. Further updates and information on the Demerger will be provided by Zenith in due course (ASX Release 13-Jan-22).

Zenith Minerals Limited (ASX:ZNC)

Zenith has a vision to maximise shareholder value through superior project generation and exploration activities.

Key Australian gold and base metal projects include:

| Earaheedy | Zinc | Western Australia | 25% free carry to BFS |

2.5M shares in American Rare Earths (ASX:ARR)

0.5M shares in Nickel-X Limited (ASX:NKL)

JORC Tables

Section 1 Sampling Techniques and Data for Zenith

Aircore Drilling

(Criteria in this section apply to all succeeding sections.)

| Criteria | JORC Code explanation | Commentary |
|-----------------------|--|---|
| Sampling techniques | <i>Nature and quality of sampling (e.g. cut channels, random chips, or specific specialised industry standard measurement tools appropriate to the minerals under investigation, such as down hole gamma sondes, or handheld XRF instruments, etc.). These examples should not be taken as limiting the broad meaning of sampling.</i> | Generally, 4m composite with very few 1m samples of aircore and slimline RC (SLRC) drill samples were collected at depths ranging from 0 to 81m depth. Samples were collected via a cyclone. |
| | <i>Include reference to measures taken to ensure sample representivity and the appropriate calibration of any measurement tools or systems used.</i> | Samples are representative of the intervals sampled. |
| | <i>Aspects of the determination of mineralisation that are Material to the Public Report. In cases where 'industry standard' work has been done this would be relatively simple (e.g. 'reverse circulation drilling was used to obtain 1 m samples from which 3 kg was pulverised to produce a 30 g charge for fire assay'). In other cases more explanation may be required, such as where there is coarse gold that has inherent sampling problems. Unusual commodities or mineralisation types (e.g. submarine nodules) may warrant disclosure of detailed information.</i> | Aircore drilling was used to obtain 4 m composite and 1 m samples from which 2 kg was pulverised with analysis for gold by 50g fire assay with AAS finish |
| Drilling techniques | <i>Drill type (e.g. core, reverse circulation, open-hole hammer, rotary air blast, auger, Bangka, sonic, etc.) and details (e.g. core diameter, triple or standard tube, depth of diamond tails, face-sampling bit or other type, whether core is oriented and if so, by what method, etc.).</i> | Aircore |
| Drill sample recovery | <i>Method of recording and assessing core and chip sample recoveries and results assessed.</i> | Samples were visually assessed in the field and using an estimated bulk density compared against theoretical mass to estimate recovery. |
| | <i>Measures taken to maximise sample recovery and ensure representative nature of the samples.</i> | Aircore and slimline RC ensured good recoveries through-out the drill program, holes that ended in high-water ingress were terminated to ensure adequate sample recovery. |
| | <i>Whether a relationship exists between sample recovery and grade and whether sample bias may have occurred due to preferential loss/gain of fine/coarse material.</i> | Acceptable overall sample recoveries through-out drill program no bias likely. |

| | | |
|--|--|--|
| Logging | <i>Whether core and chip samples have been geologically and geotechnically logged to a level of detail to support appropriate Mineral Resource estimation, mining studies and metallurgical studies.</i> | All drill samples were logged by a qualified geologist and descriptions recorded in a digital data base. |
| | <i>Whether logging is qualitative or quantitative in nature. Core (or costean, channel, etc.) photography.</i> | Qualitative logging, representative sample retained for each drill metre. |
| | <i>The total length and percentage of the relevant intersections logged.</i> | 100% |
| Sub-sampling techniques and sample preparation | <i>If core, whether cut or sawn and whether quarter, half or all core taken.</i> | No core |
| | <i>If non-core, whether riffled, tube sampled, rotary split, etc. and whether sampled wet or dry.</i> | Cone splitter for each 4m composite sample. |
| | <i>For all sample types, the nature, quality and appropriateness of the sample preparation technique.</i> | Samples were analysed at Nagrom Laboratories in Perth, 2 kg was pulverised and a representative subsample was analysed for gold by 50g fire assay with AAS finish. |
| | <i>Quality control procedures adopted for all sub-sampling stages to maximise representivity of samples.</i> | ~200g of sample was pulverised and a sub-sample was taken in the laboratory and analysed. |
| Sub-sampling techniques and sample preparation - continued | <i>Measures taken to ensure that the sampling is representative of the in situ material collected, including for instance results for field duplicate/second-half sampling.</i> | Duplicate samples were taken in the field and analysed as part of the QA/QC process |
| | <i>Whether sample sizes are appropriate to the grain size of the material being sampled.</i> | Each sample was approximately 2kg in weight which is appropriate to test for the grain size of material sampled. |
| Quality of assay data and laboratory tests | <i>The nature, quality and appropriateness of the assaying and laboratory procedures used and whether the technique is considered partial or total.</i> | Samples were analysed at Nagrom Laboratories in Perth, 2 kg was pulverised and a representative subsample was analysed for gold by 50g fire assay with AAS finish. |
| | <i>For geophysical tools, spectrometers, handheld XRF instruments, etc., the parameters used in determining the analysis including instrument make and model, reading times, calibrations factors applied and their derivation, etc.</i> | No geophysical tools used in this program. |
| | <i>Nature of quality control procedures adopted (e.g. standards, blanks, duplicates, external laboratory checks) and whether acceptable levels of accuracy (i.e. lack of bias) and precision have been established.</i> | Blanks, certified reference material for gold, and duplicate samples were included in the analytical batches and indicate acceptable levels of accuracy and precision. |
| Verification of sampling and assaying | <i>The verification of significant intersections by either independent or alternative company personnel.</i> | At least 2 Zenith company personnel have been to the prospect area and observed samples and representative drill chip samples |
| | <i>The use of twinned holes.</i> | Nil |

| | | |
|--|---|---|
| | <i>Documentation of primary data, data entry procedures, data verification, data storage (physical and electronic) protocols.</i> | Field data were all recorded on paper logs and sample record books and then entered into a database |
| | <i>Discuss any adjustment to assay data.</i> | No adjustments were made. |
| <i>Location of data points</i> | <i>Accuracy and quality of surveys used to locate drill holes (collar and down-hole surveys), trenches, mine workings and other locations used in Mineral Resource estimation.</i> | Sample location is based on GPS coordinates +/-5m accuracy. |
| | <i>Specification of the grid system used.</i> | The grid system used to compile data was MGA94 Zone 50 |
| <i>Location of data points – continued</i> | <i>Quality and adequacy of topographic control.</i> | Topography control is +/- 10m. |
| <i>Data spacing and distribution</i> | <i>Data spacing for reporting of Exploration Results.</i> | Refer to Figures 2 - 4 |
| | <i>Whether the data spacing and distribution is sufficient to establish the degree of geological and grade continuity appropriate for the Mineral Resource and Ore Reserve estimation procedure(s) and classifications applied.</i> | There is insufficient information to calculate a mineral resource |
| | <i>Whether sample compositing has been applied.</i> | Simple weight average mathematical compositing applied |
| <i>Orientation of data in relation to geological structure</i> | <i>Whether the orientation of sampling achieves unbiased sampling of possible structures and the extent to which this is known, considering the deposit type.</i> | All Zenith drilling is -60 degrees east and is close to representing true width thickness of the west dipping gold mineralisation, based on the current geological interpretation. Further drilling is required to confirm this interpretation. |
| | <i>If the relationship between the drilling orientation and the orientation of key mineralised structures is considered to have introduced a sampling bias, this should be assessed and reported if material.</i> | No bias based on current interpretation. |
| <i>Sample security</i> | <i>The measures taken to ensure sample security.</i> | All samples were taken by Zenith personnel on site and retained in a secure location until delivered directly to the laboratory by Zenith personnel. |
| <i>Audits or reviews</i> | <i>The results of any audits or reviews of sampling techniques and data.</i> | The sampling techniques and data have been reviewed by two company personnel who are qualified as Competent Persons |

Section 2 Reporting of Exploration Results

(Criteria listed in the preceding section also apply to this section.)

| Criteria | JORC Code explanation | Commentary |
|---|--|---|
| Mineral tenement and land tenure status | Type, reference name/number, location and ownership including agreements or material issues with third parties such as joint ventures, partnerships, overriding royalties, native title interests, historical sites, wilderness or national park and environmental settings. | Zenith announced on the 21 st March 2019 that it has a 2-year option (subsequently extended by a year) to explore for bedrock gold (any gold 6 metres below surface) and lithium mineralisation on tenements covering the operating Dulcie Heap Leach Gold Project (DHLGO) in exchange for surface laterite gold rights on Zenith's adjoining exploration licence E77/2388. Zenith may at its sole election exercise the option through the payment of a 2% NSR royalty payable on any future bedrock gold production from the DHLGO project area. The project is located predominantly in vacant crown land. |
| | The security of the tenure held at the time of reporting along with any known impediments to obtaining a licence to operate in the area. | Tenements are mining leases and prospecting leases, current heap leach operation is active, no known impediments to obtain a licence to operate. |
| Exploration done by other parties | Acknowledgment and appraisal of exploration by other parties. | Refer to ASX release 21 st March 2019. |
| Geology | Deposit type, geological setting and style of mineralisation. | Archean mesothermal lode gold mineralisation hosted within banded iron formation (BIF) and mafic rock types. |
| Drill hole Information | A summary of all information material to the understanding of the exploration results including a tabulation of the following information for all Material drill holes: | Refer to Figures and Tables in body of text of this ASX release. |
| | o easting and northing of the drill hole collar | |
| | o elevation or RL (Reduced Level – elevation above sea level in metres) of the drill hole collar | |
| | o dip and azimuth of the hole | |
| | o down hole length and interception depth | |
| | o hole length. | |
| | If the exclusion of this information is justified on the basis that the information is not Material and this exclusion does not detract from the understanding of the report, the Competent Person should clearly explain why this is the case. | |
| Data aggregation methods | In reporting Exploration Results, weighting averaging techniques, maximum and/or minimum grade truncations (e.g. cutting of high grades) and cut-off grades are usually Material and should be stated. | High-grade intersections are length weighted average grades with minimum cut -off grade of 1.0g/t Au and no internal dilution, whilst lower grade intersections are length weighted average grades with minimum cut-off grade of 0.4g/t Au and maximum internal dilution of 4m. |
| | Where aggregate intercepts incorporate short lengths of high-grade results and longer lengths of low grade results, the procedure used for such aggregation should be stated and some typical examples of such aggregations should be shown in detail. | As above and included in Tables |

| | | |
|---|--|---|
| <i>Data aggregation methods - continued</i> | <i>The assumptions used for any reporting of metal equivalent values should be clearly stated.</i> | No metal equivalents used. |
| <i>Relationship between mineralisation widths and intercept lengths</i> | <i>These relationships are particularly important in the reporting of Exploration Results.</i> | Drilling is angled -60 degrees east or vertical and based on current interpretation is thought to be representing true width thickness of the flat lying supergene or gentle west dipping gold mineralised zones however further drilling is required to confirm this interpretation. |
| | <i>If the geometry of the mineralisation with respect to the drill hole angle is known, its nature should be reported.</i> | As above |
| | <i>If it is not known and only the down hole lengths are reported, there should be a clear statement to this effect (e.g. 'down hole length, true width not known').</i> | Mineralised intervals reported are down-hole lengths but are believed to be close to true thickness |
| <i>Diagrams</i> | <i>Appropriate maps and sections (with scales) and tabulations of intercepts should be included for any significant discovery being reported These should include, but not be limited to a plan view of drill hole collar locations and appropriate sectional views.</i> | Refer to Figures and Tables in body of text of this ASX release. |
| <i>Balanced reporting</i> | <i>Where comprehensive reporting of all Exploration Results is not practicable, representative reporting of both low and high grades and/or widths should be practiced to avoid misleading reporting of Exploration Results.</i> | Refer to Figures and Tables in body of text of this ASX release. |
| <i>Other substantive exploration data</i> | <i>Other exploration data, if meaningful and material, should be reported including (but not limited to): geological observations; geophysical survey results; geochemical survey results; bulk samples – size and method of treatment; metallurgical test results; bulk density, groundwater, geotechnical and rock characteristics; potential deleterious or contaminating substances.</i> | No other meaningful or material exploration data to be reported at this stage. |
| <i>Further work</i> | <i>The nature and scale of planned further work (e.g. tests for lateral extensions or depth extensions or large-scale step-out drilling).</i> | Follow-up drilling planned. |
| | <i>Diagrams clearly highlighting the areas of possible extensions, including the main geological interpretations and future drilling areas, provided this information is not commercially sensitive.</i> | Refer to figures in body of this report. |
